

# Antihyperlipidemic Drugs

Drug	MOA	Effects	Side Effects	Notes
Niacin	<ul style="list-style-type: none"> <li>In adipose tissue: <b>inhibits</b> the lipolysis of triglycerides by <b>inhibiting adipocyte adenyl cyclase</b>, which reduces transport of free fatty acids to the liver and decreases hepatic triglyceride synthesis.</li> <li>May <b>inhibit</b> a rate-limiting enzyme of triglyceride synthesis, <b>diacylglycerol acetyltransferase 2</b>.</li> <li><b>Reduction</b> of triglyceride <b>synthesis reduces</b> hepatic VLDL &amp; consequently LDL.</li> <li><b>Inhibits</b> intracellular <b>lipase</b> in adipose tissues leading to decreased FFA flux to the liver.</li> </ul>	<ul style="list-style-type: none"> <li>Hypolipidemic effects only in <b>large</b> doses (has low potency)</li> <li>Affects all lipid parameters:                             <ul style="list-style-type: none"> <li>Best agent to <b>increase</b> HDL-C</li> <li><b>Lowers</b> triglycerides</li> <li><b>Decreases</b> LDL-C production</li> <li><b>Reduces</b> fibrinogen levels</li> <li><b>Increases</b> plasminogen activator</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li><b>Toxicity:</b> <ul style="list-style-type: none"> <li>Harmless cutaneous vasodilation and sensation of warmth, can be <b>prevented</b> by NSAIDs</li> <li>Pruritus, rashes, dry skin and mucus membranes (acanthosis nigricans: black discoloration)</li> <li>Nausea, vomiting, abdominal discomfort, diarrhea</li> <li>Elevations in transaminases and possible hepatotoxicity</li> <li>Insulin resistance &amp; hyperglycemia</li> <li>Hyperuricemia and gout</li> <li>Cardiac arrhythmias</li> <li>Amblyopia, blurring of vision</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Nicotinic Acid or Vitamin B3</li> <li>Water-soluble B-complex vitamin, functions only after conversion to NAD<sup>+</sup> or NADP<sup>+</sup> nicotinamide</li> <li>Completely absorbed, peaks within 1hr, half-life is about 1 hr, so needs to be given twice or thrice daily (inconvenient)</li> <li>Generally: all anti-hyperlipidemic drugs cause myopathy <b>except for Niacin</b></li> </ul>
<b>Fibrates (Fibric Acid Derivatives): PPARs Activators</b>				
<ul style="list-style-type: none"> <li><b>Clofibrate</b></li> <li><b>Gemfibrozil</b></li> <li><b>Fenofibrate</b></li> <li><b>Bezafibrate</b></li> </ul>	<ul style="list-style-type: none"> <li>Activate PPAR- α (Peroxisome Proliferator Activated Receptor- α) which stimulates fatty acid oxidation, increases LPL synthesis, and reduces expression of apoC-III, and increases apoA-I and apoA-II expression (the major apolipoproteins in HDL)</li> </ul>	<ul style="list-style-type: none"> <li><b>Drugs of choice</b> in severe hypertriglyceridemia</li> <li>Lipid parameter affected:                             <ul style="list-style-type: none"> <li><b>Increase</b> lipolysis of lipoprotein triglyceride via LPL</li> <li><b>Decrease</b> levels of VLDL and LDL</li> <li>Moderately <b>increase</b> HDL</li> </ul> </li> <li>Have <b>anticoagulant</b> and <b>fibrinolytic</b> activities</li> </ul>	<ul style="list-style-type: none"> <li>Rashes, urticaria, hair loss, headache, GIT symptoms, impotence, and anemia.</li> <li>Myalgia, fatigue, myopathy and rhabdomyolysis (breakdown of muscle fibers resulting in the release of muscle fiber contents (myoglobin) into the blood)</li> <li>Risk of cholesterol gallstones</li> <li>Elevated transaminases or alkaline phosphatase</li> </ul>	<ul style="list-style-type: none"> <li>The first drug was Clofibrate in 1962 but it was discontinued in 1987</li> <li>Interact with <b>statins, levels of both drugs will increase</b></li> <li><b>*Used with caution in renal failure</b></li> </ul>
<b>Bile Acid –Binding Resins</b>				
<ul style="list-style-type: none"> <li><b>Colestipol</b></li> <li><b>Cholestyramine</b></li> <li><b>Colessevelam</b></li> </ul>	<ul style="list-style-type: none"> <li>Large polymeric anionic- exchange resins, insoluble in water, which bind the negatively charged bile acids in the intestinal lumen and <b>prevent their reabsorption</b> leading to depletion of bile acid pool and increased hepatic synthesis →</li> </ul>	<ul style="list-style-type: none"> <li><b>*Indications:</b> <ul style="list-style-type: none"> <li>Lower LDL as much as 25%, but will cause GI side effects</li> <li>Relieve pruritus in cholestasis (abnormal bile flow)</li> <li><b>Digitalis toxicity</b>, can bind digitoxin and enhance its excretion</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Gritty sensation is unpleasant but can be tolerated</li> <li>Constipation, bloating &amp; gallstones</li> <li>Malabsorption of Vitamin K</li> <li>Gall stones &amp; Heartburn</li> <li>Impaired absorption of drugs</li> </ul>	<ul style="list-style-type: none"> <li>Probably the <b>safest drugs</b>, since they are not absorbed from the intestine because of their large size</li> <li>Maximal doses are effective but cause side effects</li> <li>May increase triglyceride levels</li> </ul>

# Antihyperlipidemic Drugs

Drug	MOA	Effects	Side Effects	Notes
Bile Acid Binding Resins (Cont.)	→ Hepatic cholesterol content is <b>decreased</b> , stimulating the production of LDL receptors → <b>increased LDL clearance</b> and lowered LDL-C levels (this effect is partially offset by the enhanced cholesterol synthesis caused by upregulation of HMG-CoA reductase)			
<b>Statins</b>				
<ul style="list-style-type: none"> <li>▫ <u>Mevastatin</u></li> <li>▫ <u>Simvastatin</u></li> <li>▫ <u>Lovastatin</u></li> <li>▫ <u>Pravastatin</u></li> <li>▫ <u>Fluvastatin</u></li> <li>▫ <u>Atorvastatin</u></li> <li>▫ <u>Rosuvastatin</u></li> </ul>	<p>▫ Competitive Inhibitors of HMG-CoA Reductase (the early rate-limiting enzyme in de novo synthesis of cholesterol)</p>	<p>▫ <b>Most effective</b> drugs in lowering LDL</p> <p>▫ <b>Major effect:</b> Reduced free cholesterol in hepatocytes activates a protease which will cleave membrane-bound SREBP → will be translocated to the nucleus to stimulate transcription of LDL receptors → Increased removal of LDL-C from the blood → <b>lowering blood LDL-C levels and preventing CHD.</b></p> <p>▫ <b>Minor effect:</b> reduce LDL levels by enhancing the <b>removal</b> of LDL precursors (VLDL and IDL) and by <b>decreasing</b> hepatic VLDL production</p> <p>▫ <b>Higher doses</b> can reduce triglyceride levels caused by elevated VLDL levels</p> <p>▫ Some (simvastatin and rosuvastatin) can <b>raise HDL-C levels</b></p> <p>▫ <b>Decrease</b> oxidative stress and vascular inflammation by <b>enhancing NO production</b></p> <p>▫ <b>Reduce</b> platelet aggregation</p>	<p>▫ Important side effects:</p> <ul style="list-style-type: none"> <li>-<b>Elevation of transaminases</b>, this is intermittent and not associated with strong evidence of liver failure</li> <li>-<b>Elevation of creatine kinase (CK)</b> activity</li> <li>-<b>Rhabdomyolysis</b>, causing myoglobinuria and renal injury and failure or even death (extremely rare)</li> <li>-<b>Lupus-like disorder and peripheral neuropathy</b></li> </ul> <p>▫ Less important side effects:</p> <ul style="list-style-type: none"> <li>-Headache, Difficulty sleeping, Flushing of the skin, Muscle aches, tenderness, or weakness (myalgia)</li> <li>-Drowsiness, Dizziness, Nausea and/or vomiting</li> <li>-Abdominal cramping and/or pain, Bloating and/or gas, Diarrhea, Constipation, Rash</li> </ul> <p><b>*Memory loss, mental confusion, high blood sugar, and type 2 diabetes are possible side effects</b></p>	<p>-Most commonly prescribed drugs worldwide</p> <p>-Isolated from a mold called Penicillium Citrinum, in 1976</p> <p>-Toxicity is dose-related, associated with advanced age, hepatic or renal dysfunction, small body size, associated diseases, hypothyroidism and concomitant drugs</p> <p>-Statins may interact with other medications</p> <p>-Statins are metabolized by the <b>CYP450</b> enzyme system, which is a subject to <b>individual genetic differences</b>. These differences will be exhibited for their: therapeutic response &amp; side effects.</p>

# Antihyperlipidemic Drugs

Drug	MOA	Effects	Side Effects	Notes
<b>Inhibitors of Sterol Absorption</b>				
Ezetimibe	<p>▫Inhibitor of NPC1L1, a protein in jejunal brush border, essential for cholesterol absorption</p>	<p>-<b>Reduces</b> cholesterol <b>absorption and reabsorption</b> by 54%, precipitating a compensatory increase in cholesterol synthesis</p> <p>-<b>Reduces</b> cholesterol <b>delivery</b> to the liver by the chylomicron remnants</p> <p>→This will stimulate the expression of the hepatic genes regulating the LDL receptor expression leading to enhanced LDL-C clearance from the plasma (15- 20%)</p> <p>*Action is <b>complementary to statins</b> (together they cause 60% reduction in LDL-C)</p>	<p>-Can cause allergic reactions, reversible impairment of liver function tests and myopathy.</p>	
<b>Inhibitors of Cholesteryl Ester Transfer Protein</b>				
<p>▫Torcetrapib</p> <p>▫Anacetrapib</p> <p>▫Dalcetrapib</p>	<p>▫Inhibitors of cholesteryl ester transfer protein (CETP) → resulting in increased levels of HDL</p>	<p>-Can <b>increase HDL levels</b> by 45-106% in humans → effective in patients whose main problem is <b>low levels of HDL</b>.</p>		<p>-CETP is a plasma glycoprotein synthesized by the liver that mediates the transfer of cholesteryl esters from HDL to triglyceride-rich lipoproteins and LDL in exchange for a molecule of triglyceride</p> <p>-Torcetrapib was <b>withdrawn</b></p>
