

Drug	Definition	Properties	Systemic Effects	Side Effects	Contraindications	Drug interactions
Halothane	Halogen substituted ethane Oxidised by hepatic cyt P-450	Volatile liquid easily vaporized stable nonflammable Most potent inhalational anesthetic (MAC of 0.75%) Very soluble in blood and adipose (slow onset and offset)	Cardiovascular:  <ul style="list-style-type: none"> • Direct myocardial depression • Coronary artery vasodilator • Blunt the reflex tachycardia to hypotension • Sensitizes the heart to the arrhythmogenic effects of epinephrine Respiratory:  <ul style="list-style-type: none"> • Rapid, shallow breathing <ul style="list-style-type: none"> • Resting PaCO₂: ↑ • Alveolar ventilation: ↓ • potent bronchodilator Cerebral and neuromuscular:  <ul style="list-style-type: none"> • CBF ↑ <ul style="list-style-type: none"> • Blunt autoregulation of constant CBF <ul style="list-style-type: none"> • ICP: ↑ • Metabolic oxygen requirement: ↓ <ul style="list-style-type: none"> • Relaxes skeletal muscle • A triggering agent of malignant hyperthermia Renal and Hepatic: <ul style="list-style-type: none"> • ↓Renal BF thus ↓GFR, U/O <ul style="list-style-type: none"> • ↓Hepatic BF 	<ul style="list-style-type: none"> • Malignant Hyperthermia: <u>Defined as:</u> <u>hypermetabolic state by inhibition of calcium reuptake in sarcoplasmic reticulum</u> LEADS TO: rapid rise in body temperature, muscle rigidity, tachycardia, rhabdomyolysis, acidosis, hyperkalemia, DIC, rise in CPK levels, myoglobinuria Trx by: hyperventilation, HCO₃⁻, IV DANTROLENE, diuretics, cooling blankets • Halothane Hepatitis: metabolised by cyt P-450, fever, jaundice, hepatic necrosis, death 	<ul style="list-style-type: none"> - Unexplained liver dysfunction following previous exposure - Elevation of ICP - Hypovolaemia - Severe cardiac disease - MALIGNANT HYPERTHERMIA 	B-blockers CCBs Aminophylline: serious ventricular arrhythmia

Enflurane	Halogenated methyl ethyl ether	Stable Nonflammable Liquid MAC 1.68% NOT USED ANYMORE DUE TO SEs	Cardiovascular:  <ul style="list-style-type: none"> • Potent inotropic and chronotropic depressant <ul style="list-style-type: none"> • decreases systemic vascular resistance so it lowers blood pressure and conduction dramatically • Sensitizes the heart to the arrhythmogenic effects of epinephrine • Blunts sympathetic baroreflex response Respiratory:  <ul style="list-style-type: none"> • increases dead space • widens A-a gradient • drive is greatly depressed • produces hypercarbia in spontaneously breathing patient • bronchodilator 	<ul style="list-style-type: none"> • Renal toxicity: metabolism releases F- ion • Hepatotoxicity: less than that of halothane • Brain: epileptiform EEG patterns <ul style="list-style-type: none"> • MALIGNANT HYPERTHERMIA 		
Isoflurane	Halogenated methyl ethyl ether, a chemical isomer of enflurane	Nonflammable pungent MAC of 1.20 %	Cardiovascular:  <ul style="list-style-type: none"> • Minimal cardiac depression • Produces most significant reduction in systemic vascular resistance) → BP: ↓ • Sensitizes myocardium to catecholamines -- less than halothane or enflurane 	MALIGNANT HYPERTHERMIA		

			<p>Respiratory: 🫁</p> <ul style="list-style-type: none"> • Respiratory depression • Blunt the normal ventilatory response to hypoxia and hypercapnia • Irritate upper airway reflex <ul style="list-style-type: none"> • good bronchodilator <p>Cerebral and neuromuscular: 🧠</p> <ul style="list-style-type: none"> • CBF ↑ • ICP: ↑ • Metabolic oxygen requirement: ↓ • Relaxes skeletal muscle • A triggering agent of malignant hyperthermia <p>Renal and Hepatic:</p> <ul style="list-style-type: none"> • ↓Renal BF thus ↓GFR, U/O <ul style="list-style-type: none"> • ↓Hepatic BF 			
<i>Desflurane</i>	Halogenated methyl ethyl ether, a chemical isomer of enflurane	High vapor pressure thus requires SPECIAL VAPORISER Low solubility → ultrashort duration of action MAC 6% (moderate potency)	<p>Cardiovascular: ❤️</p> <ul style="list-style-type: none"> • Systemic vascular resistance: ↓ So BP: ↓ • CO: unchanged or slightly depressed • Rapid increases in concentration lead to transient elevation in HR, BP, catecholamine levels <p>Respiratory: 🫁</p> <ul style="list-style-type: none"> • Tidal volume: ↓, RR: ↑ • Alveolar ventilation: ↓ • Resting PaCO₂: ↑ • Depress the ventilatory response to ↑ PaCO₂ 	<ul style="list-style-type: none"> • Degraded by desiccated CO₂ absorbent into carbon monoxide • MALIGNANT HYPERTHERMIA 	<ul style="list-style-type: none"> - Elevation of ICP <ul style="list-style-type: none"> - Hypovolaemia - MALIGNANT HYPERTHERMIA 	

			<ul style="list-style-type: none"> • Pungency and airway irritation Cerebral and neuromuscular: 🧠 <ul style="list-style-type: none"> • CBF↑ • ICP: ↑ • Metabolic oxygen requirement: ↓ • A triggering agent of malignant hyperthermia Renal: <ul style="list-style-type: none"> • ↓U/O 			
Sevoflurane		<p>Non pungent Smooth and rapid inhalation inductions in pediatric and adult patients Rapid increase in alveolar anesthetic concentration MAC 2%</p>	Cardiovascular: ❤️ <ul style="list-style-type: none"> • Mildly depress myocardial contractility • Systemic vascular resistance, arterial BP: ↓ • CO: not maintained well due to little rise in HR Respiratory: 🫁 <ul style="list-style-type: none"> • Rapid shallow breathing • Depress respiration • Reverse bronchospasm Cerebral and neuromuscular: 🧠 <ul style="list-style-type: none"> ◦ CBF, ICP: slight ↑ ◦ Cerebral metabolic oxygen requirement: ↓ ◦ Adequate muscle relaxation for intubation of children Renal and Hepatic: Impaired renal tubule function Portal vein blood flow: ↓	Renal toxicity: Degraded by alkali (barium hydroxide lime, soda lime), producing nephrotoxic end products (compound A) MALIGNANT HYPERTHERMIA	<ul style="list-style-type: none"> - Elevation of ICP - Severe Hypovolaemia - MALIGNANT HYPERTHERMIA 	

<p>Nitrous Oxide</p>		<p>The only inorganic anesthetic gas in clinical use</p> <ul style="list-style-type: none"> • Characterized by inert nature with minimal metabolism • Colorless, odorless, tasteless, and does not burn • Weak anaesthetic, good analgesic • Major difference is low potency with MAC value being 104% • Needs other agents for surgical anesthesia • Low blood solubility 	<p>Cardiovascular: ❤️</p> <ul style="list-style-type: none"> • Depress myocardial contractility • Arterial BP, CO, HR: unchanged or slightly ↑ due to stimulation of catecholamines • Constriction of pulmonary vascular smooth muscle → increase pulmonary vascular resistance • Peripheral vascular resistance: not altered <p>Respiratory: 🫁</p> <ul style="list-style-type: none"> • Respiratory rate: ↑ • Tidal volume: ↓ • Minute ventilation, resting arterial CO₂: minimal change • Hypoxic drive (ventilatory response to A. hypoxia): ↓ <p>Cerebral and neuromuscular: 🧠</p> <ul style="list-style-type: none"> • CBF, cerebral blood volume, ICP: ↑ • Cerebral oxygen consumption (CMRO₂): ↑ • DOES NOT provide significant muscle relaxation • DOES NOT trigger malignant hyperthermia <p>Renal and Hepatic:</p> <ul style="list-style-type: none"> • Increase renal vascular resistance • Renal blood flow, GFR, U/O: ↓ 		<ul style="list-style-type: none"> • Pneumothorax • Air embolism • Acute intestinal obstruction • Intracranial air • Pulmonary air cysts • Intraocular air bubbles • Tympanic membrane grafting • Pulmonary HTN 	
-----------------------------	--	--	--	--	---	--

			<ul style="list-style-type: none"> • Hepatic blood flow: ↓ • GI: 🤮 • Postoperative nausea and vomiting (PONV) • Effects: • Beginning of case: second gas effect <ul style="list-style-type: none"> • Inhibits vitamin B-12 metabolism • Diffusion into closed spaces <u>thus the contraindications</u> 			
Xenon	Very close to the 'ideal agent'	Nonexplosive, non-pungent, odorless and chemically inert No metabolism Low toxicity High cost MAC 71% Has some analgesic effects	<ul style="list-style-type: none"> • Reduces anesthesia-emergent nausea and vomiting • Minimal hemodynamic effects • DOES NOT trigger malignant hyperthermia 			

In addition, there are some OBSTETRIC EFFECTS that make neuroaxial (regional) anaesthesia preferred over GA, these inhalational agents:

- Produce dose dependent decrease in uterine contractility and blood flow
- May cause uterine atony and PPH
- Rapidly cross the placenta and reach the foetus

There's also higher risk of aspiration during surgery (as pregnant ladies have increased intraabdominal pressure)
