

Antipsychotics adverse effects

System affected		More with	Onset
Endocrine	<p>Hyperprolactinemia</p> <ul style="list-style-type: none"> - Due to dopamine blockade in the tuberohypophyseal system. ? Associated with: <ul style="list-style-type: none"> - Gynecomastia - Galactorrhea - Menstrual irregularities - Decreased libido - Sexual dysfunction <p>Wt. gain</p> <ul style="list-style-type: none"> - Due to: - Antihistaminic - Antimuscarinic - Anti serotonergic effects. 	<p><u>(1st > 2nd)</u></p> <p><u>(2nd > 1st)</u></p>	
CVS	<ol style="list-style-type: none"> 1. <u>Due to α-adrenergic blockade</u>: <ul style="list-style-type: none"> - Orthostatic hypotension - Reflex tachycardia 2. Sinus tachycardia (<u>due to anticholinergic</u>) 3. Sudden cardiac death 4. Prolonged QTc → PVA (eg: Torsade de pointes) 		

	<p>syndrome) <u>MOST COMMON WITH THIORIZADONE (FGA)</u></p> <p>5. Elevation of serum TAGs and cholesterol.</p>		
Anticholinergic adverse effects	<p>? Dry mouth</p> <p>? Constipation</p> <p>? Tachycardia (sinus tachy)</p> <p>? Blurred vision</p> <p>? Impairment of erection</p> <p>? Urinary retention</p> <p>? Impaired memory</p> <p>? Paralytic ileus</p> <p>? Necrotizing enterocolitis</p>		
<p>CNS</p> <p>1 EPS (movement disorder due to excess dopamine blockade in the nigrostriatal pathway)</p> <p> <ul style="list-style-type: none"> Dystonia Akathasia Pseudoparkinsonism... Tardive dyskinesia </p>	<p>EPS (1-4)</p> <p>1. Dystonia: Prolonged tonic contractions.</p> <ul style="list-style-type: none"> - They can be life threatening, as in the case of pharyngeal laryngeal dystonias. - Contributes to patient's non adherence. - They include trismus, glossospasm, tongue protrusion, pharyngeal-laryngeal dystonia, blepharospasm, oculogyric crisis (spasmodic movements of the 	1st >>>>> 2 nd	1-4 days initiated, increased the dopaminergic

	<p>eyeballs into a fixed position, usually upwards), torticollis, and retrocollis.</p> <ul style="list-style-type: none"> - TREATMENT: IV or IM BDZ or anticholinergics. <p>2. Akathasia: Inability to sit still, associated with functional motor restlessness (pacing, shuffling, tapping, shifting)</p> <ul style="list-style-type: none"> - Associated with dysphoria, insomnia, increased suicidality, tardive dyskinesia. - TRETMENT: <ol style="list-style-type: none"> 1. BDZ (but not in abuse) 2. B-blockers (propanolol, nadolol, metoprolol) 3. Serotonin antagonists (cryptoheptadine, mirtazipine, trazodone). 	<p>1st >>>> 2nd</p> <ul style="list-style-type: none"> - Quitipine and clozapine have the lowest risk to produce akathasia. 	
--	--	---	--

3. Pseudoparkinsonism

- Due to D₂ blockade in the nigrostriatum.
- More common with FGAs.
- The onset is typically 1 - 2 weeks after initiation or a dose increase.
- Can be treated with anticholinergic drugs (trihexyphenidyl, benztropine, orphenadrine), but may produce euphoria.
- Amantadine may be effective, but have less effect on memory function.
- Rotigotine, a dopamine agonist, may be effective.
- The risk of pseudoparkinsonism with SGAs is low, but may occur with risperidone at relatively large doses.
- Quetiapine, aripiprazole, and clozapine are reasonable alternatives in a patient experiencing EPS with other SGAs.

4. Tardive dyskinesia

- It is a syndrome characterized by abnormal involuntary movements buccal-lingual-masticatory, or orofacial.
- The onset is usually insidious, and appears late after initiation.
- The first detectable signs of tardive dyskinesia are mild forward, backward, or lateral movements of the tongue.
- Associated with higher overall morbidity and mortality.
- More prevalent with FGAs (20 - 50%).
- Short-term treatment of TD with either clonazepam or ginkgo biloba may be effective.
- Clozapine decreases abnormal involuntary movements.

2. Sedation

- Better at bedtime (can decrease daytime sedation)

- Chlorpromazine
- Thioridazine
- Clozapine
- Olanzapine
- Quetiapine

3. Seizures

- More seizures.

Antipsychotics decrease the threshold for seizures.

*Seizures reported with many antipsychotics but more with:

- Clozapine
- Chlorpromazine

early after treatment + decrease with time
